

ICE GUARD – INSTALLATION v2

This photo shows the 2 top covers in place.

This photo shows the heater rack removed, accomplished by pulling on it with your fingers, with your thumbs placed on the drum rim. If the ice is too thick, a ½ hr defrost will help. It also shows the 2 rails in place, restraining the ice from touching the rack (giving false readings). The gray split hose is used to help prevent the cable from getting buried in the ice. It is designed to fall off when pulled on. Note: If the hose sticks on the drum walls when inserting the rack, simply rotate the rack left & right (about ½”) until the rack slips in.

Cable Protector (Hose cut to length)
